Swayam Prashant Jagtap

Data Science Student | Python Developer (ongoing) | Blogger

What I'm doing right now

Between surviving my third year of Data Science and beating Python into submission via the 100 Days of Code challenge, I decided to actually build a portfolio. I created this corner of the internet as my digital diary to document the weekly chaos, track my projects (both the serious and the completely meaningless-yet-fun ones), and basically force myself to stay accountable.

VibeHack'26: The Clinkt Open Investigation Challenge

Originally built as a live, high-pressure hackathon case study at MLDC, I've now open-sourced the entire quick-commerce crisis challenge. Step into the arena, examine the case files, and uncover what went wrong behind the scenes at Clinkt.

*Case designed from scratch by Swayam Jagtap. If you build or deploy a solution, make sure to tag me on **LinkedIn** or **GitHub**!*

Help Shape My Next Research Paper (And App Concept!)

Alongside my weekly blog updates and coding projects, I've been diving into academic research on the "Guidance Gap"—the reason why learning new skills through solo online tutorials is so frustrating.

To fix this, I'm writing a paper proposing a real-world, peer-to-peer skill-shadowing app. But before I finalize the research, I need data.

Want to be part of the project? Take 2 minutes to drop your brutally honest feedback in my anonymous survey. I'll be publishing the final insights and data right here on the site once it's done!

About Me

Who I am

I'm Swayam, a third-year Data Science student based in Mumbai. Academically speaking, you'll find me trying to decipher (successfully used some 'Heavy English' 😍😉) my own code or figuring out how to actually put my degree to use in the real world.

When I finally force myself to step away from the laptop, I'm usually out for a jog or a walk, getting a calisthenics workout in (who needs a gym, anyway?), or playing video games with a good playlist on repeat. I'm also a highly social person who loves getting out, meeting new people, and making friends. And on race weekends? You'll find me glued to the screen watching F1, hoping for a Max Verstappen masterclass.

Live Metrics & Context

If you're new here, this is a real-time snapshot of my current projects, habits, and obsessions as I build my path into Data Science and Quant Finance.

Day 06 / 100

Wrestling Python into submission

Currently fighting for my life against Angela Yu's bootcamp and wondering why my loops won't loop.

6 Projects Built

From logic scripts to text games

Moving past tutorials by actually building functional Python command-line tools.

4 Weeks Logged

Autobiographying my chaotic life

Weekly proof that I am somehow surviving college, coding bootcamps, and watching Red Bull force Max to drive an absolute tractor all at once.

1 App Concept

Solving the 'Guidance Gap'

Researching and designing a peer-to-peer skill shadowing platform for self-taught learners because trying to learn skills online alone is absolute suffering.

∞ Chai Cups

Late-night debugging fuel

The essential non-technical dependency required to make code compile successfully.

109 F1 Points

Manifesting a comeback

Dying a little inside every race weekend while watching Max drag a tractor around, praying for Red Bull to somehow fix their strategy.

What I'm working on

- **The 100 Days of Code:** Wrestling with Angela Yu's Python bootcamp and documenting the survival process.
- **Core Problem-Solving:** Writing scripts and logic games to test what I's actually learning.
- **Data Science Tools:** Slowly transitioning into the heavy-duty stuff like NumPy, Pandas, and Jupyter to actually put my degree to use.

Goals

Short-term: Go from a Python beginner to having job-ready data science skills over the next 12–18 months, while building a portfolio of projects that actually do something cool.

Long-term: I want to bridge the gap between data analysis and the financial markets. Ultimately, I've got my sights set on breaking into Quantitative Finance—but let's get my current code working first.

Let's Connect

Whether you're a recruiter, a fellow dev, or just want to debate F1 strategies, my inbox is open.

Blog

Built by me, read by you. Same time next week.

The Digital Diary

This is where I hold myself accountable. Every week, I drop a quick recap of what I studied, what I actually managed to build, the bugs that almost made me throw my laptop out the window, and what I plan to tackle next. Think of it as a public learning journal.

The Archives

- **Mid-Week Drop: The Ghost Website Isn't So Much of a Ghost Anymore** 👻
  31 active visitors, 4 from the United States, and one very unimpressed dad.
  September 16, 2026

- **Mid-Week Drop: MX4D, Heavy Luggage, and Max Running a Tractor to P2**
  A free movie, a luggage-hauling nightmare, and one very stupid CSV decision 😱
  September 14, 2026

- **Week 7: Duct-Taped Code, Cloud Servers in a Coma, and Why I Deleted Half My F1 Codebase** 🫣
  Running on RB19 Energy, Defeating Procrastination, and Scrapping My F1 Prototype.
  September 12, 2026

- **Mid-Week Drop: VibeHack is Live & The F1 Reality Check**
  The VibeHack Clinkt Challenge is officially live! Plus, a sneak peek into my F1 telemetry project.
  September 11, 2026

- **Week 6: The Muddy Trousers, A Fictional Crisis, and The VibeHack Aftermath**
  Surviving a mud-soaked commute to run VibeHack'26, dropping a 3-page fictional crisis on the participants (a literal piece of art!), watching Max finally get back on the podium, and witnessing 60 years of Italian F1 history.
  September 8, 2026

- **Week 5: Sprinting Through Exams, Hackathons, and F1 Heartbreak**
  Surviving college internal exams, sprinting straight into a high-energy hackathon, and coping with maximum F1 disappointment post Dutch GP.
  August 23, 2026

- **Week 4: Egos, Exes, and Coding Through the Chaos**
  How a sick morning jog led to the website looking gorgeous.
  August 15, 2026

- **Week 3: I Was Supposed to Reveal My App. Then I Got Hospitalized.**
  Answering all your burning FAQs about the new shadowing app, flexing my brand new comment section, and trying to manage three major events from a hospital bed.
  August 8, 2026

- **Week 2: Why I Built a Website Nobody Asked For**
  A chaotic week of surviving sickness, stepping up to head the VibeHack hackathon for the Dataverse committee, and getting a harsh reality check on leadership.
  August 2, 2026

- **Week 1: The First Week of Chaos and Code**
  Recap of Python simulators, text-based adventure games, and some quarter-final heartbreak.
  July 25, 2026

Projects

Overview

Here's where I keep the receipts. This is a collection of my personal coding builds—ranging from basic Python logic simulators to increasingly ambitious data, automation and application projects. Because watching tutorials is easy, but building things from scratch is where the actual learning (and debugging) happens.

F1 Telemetry Platform

A dataset-driven F1 telemetry explorer built from scratch using FastF1, FastAPI, WebSockets and a browser-based dashboard.

Select a season, Grand Prix, session, drivers and available laps, then stream processed telemetry directly into the dashboard in real time.

Currently powered by a 2025 Abu Dhabi dataset, with the platform designed to support additional seasons, events and sessions without restructuring the application.

Open Telemetry Dashboard | View Backend

Completed projects

- **Tip Calculator:** A basic Python program that calculates the exact tip percentage for your bill.
  View Code
- **Pizza Order:** This program simulates your pizza ordering experience, where every option you select dynamically updates your final bill.
  View Code
- **Roller Coaster:** A simulation of the rollercoaster ticket-buying process. (You'll have to try it yourself to get a better understanding!)
  View Code
- **Treasure Game:** A text-based adventure built on the logic from the Pizza and Roller Coaster programs. You have to choose your paths, and they might—or might *not*—lead you to the treasure.
  View Code
- **Rock-Paper-Scissors:** The classic hand-gesture game, brought to life using Python and the **random** library.
  View Code
- **Password Generator:** A Python program that generates passwords based on your unique requirements. Want all characters, numbers, special characters, and symbols? I've got you covered!

Academics

What can you expect here?

While my Projects page is mostly for self-taught builds and late-night coding experiments, this space is dedicated to the actual algorithms, models, and lab work I do as a third-year Data Science student. It's a mix of theory, practical implementation, and trying to figure out why the professor's code works but mine throws an error.

Programs | Mini Projects

- **Sentence segmentation and word tokenization :** Basic sentence segmentation and word tokenization techniques using Python libraries.
  View Segmentation and Tokenization Notebook on GitHub
- **Stemming and Lemmatization :** Techniques for reducing words to their root forms.
  View Stemming and Lemmatization Notebook on GitHub
- **Loading and Exploring Datasets :** Methods for loading and exploring datasets in Python.
  View Loading and Exploring Datasets Notebook on GitHub
- **Bag of Words representation using python :** A simple implementation of the Bag of Words model for text representation.
  View Bag of Words Notebook on GitHub
- **Linear Regression Implementation :** To predict housing prices based on features such as size and location.
  View Linear Regression Notebook on GitHub

Research Drafts & Concepts

A space for my academic drafts, feasibility studies, and literature reviews. Because apparently, you can't just build an app—you have to write a 20-page document proving it's actually a good idea first.

- **Sustainable Community Development Through Peer-to-Peer Learning (Working Draft)**
  My first formal research paper exploring how we can replace isolated online courses with real-world and digital shadowing experiences. It dives into the psychological drawbacks of unguided e-learning and the necessity of community-driven skill sharing.
